

Lifecycle Earnings Risk and Insurance: New Evidence from Australia

Darapheak Tin Chung Tran

Research School of Economics,
Australian National University

TTPI Seminar

June 2022

Our study

1. Better understand the nature of income shock process in Australia
 - Decompose sources of earnings changes: Wage or hour
 - Explore individual earnings risk by age and income history
2. Study the insurance role of family and government
 - Family: Market earnings and private transfers
 - Government: Progressive taxes and targeted public transfers

Data and methodology

Data: HILDA 2001-2020 (152,903 observations).

Sampling criteria: (i) Primary earner, (ii) Employment history.

Methodology: Non-parametric approach following [Guvenen et al. \(2021\)](#) and [De Nardi et al. \(2021\)](#).

Definition: Risks

Residual income shocks := changes or growth of residual income (net of age and time effects) over time.

- ▶ **Second-order income risk:** Variance of a residual income shock distribution
- ▶ **Third-order income risk:** Skewness (S) measures the lack of symmetry in data distribution of shocks. A normal distribution has $S=0$
 - ▶ S between -0.5 and 0.5: fairly symmetrical;
 - ▶ S between -1 and -0.5 or between 0.5 and 1: moderately skewed.
 - ▶ S less than -1 or greater than 1: highly skewed.
- ▶ **Forth-order income risk:** Kurtosis (K) measures the tails of a shock distribution. It is actually the measure of outliers present in data.
 - ▶ $K = 3$ (Mesokurtic): Standard normal distribution
 - ▶ $K > 3$ (Leptokurtic): Distribution is longer, tails are fatter
 - ▶ $K < 3$ (Platykurtic): Distribution is shorter, tails are thinner

Definition: Risks

Residual income shocks := changes or growth of residual income (net of age and time effects) over time.

- ▶ **Second-order income risk:** Variance of a residual income shock distribution
- ▶ **Third-order income risk:** Skewness (S) measures the lack of symmetry in data distribution of shocks. A normal distribution has $S=0$
 - ▶ S between -0.5 and 0.5: fairly symmetrical;
 - ▶ S between -1 and -0.5 or between 0.5 and 1: moderately skewed.
 - ▶ S less than -1 or greater than 1: highly skewed.
- ▶ **Forth-order income risk:** Kurtosis (K) measures the tails of a shock distribution. It is actually the measure of outliers present in data.
 - ▶ $K = 3$ (Mesokurtic): Standard normal distribution
 - ▶ $K > 3$ (Leptokurtic): Distribution is longer, tails are fatter
 - ▶ $K < 3$ (Platykurtic): Distribution is shorter, tails are thinner

Empirical distribution of annual residual earnings shocks

See 3-year average earnings residual shock distribution.

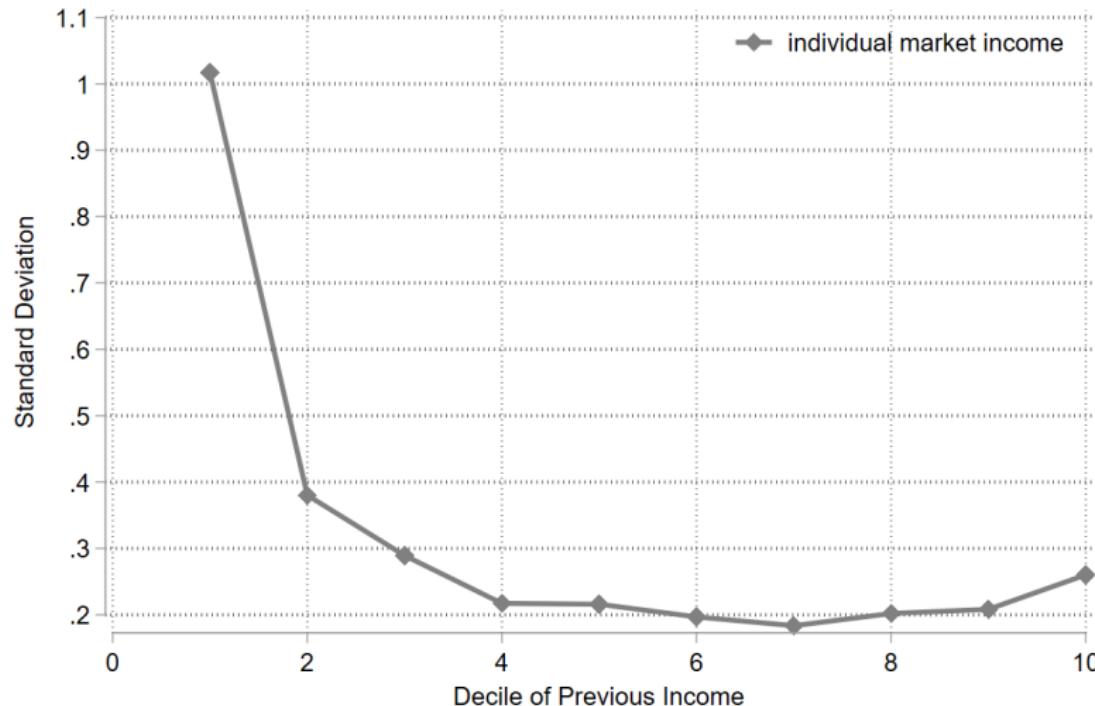

Definition: Insurance against income risks

Insurance := the extent to which an income component reduces risks.

- ▶ Market income risks $\xrightarrow[\text{(via members' annual earnings)}]{\text{family market income insurance}}$ Family market income risks
- ▶ Family market income risks $\xrightarrow[\text{(via private transfers)}]{\text{family transfer insurance}}$ Family pre-gov't income risks
- ▶ Family pre-gov't income risks $\xrightarrow[\text{(via income taxes)}]{\text{gov't tax insurance}}$ Family post-tax income risks
- ▶ Family post-tax income risks $\xrightarrow[\text{(via public transfers)}]{\text{gov't transfer insurance}}$ Family post-gov't income risks

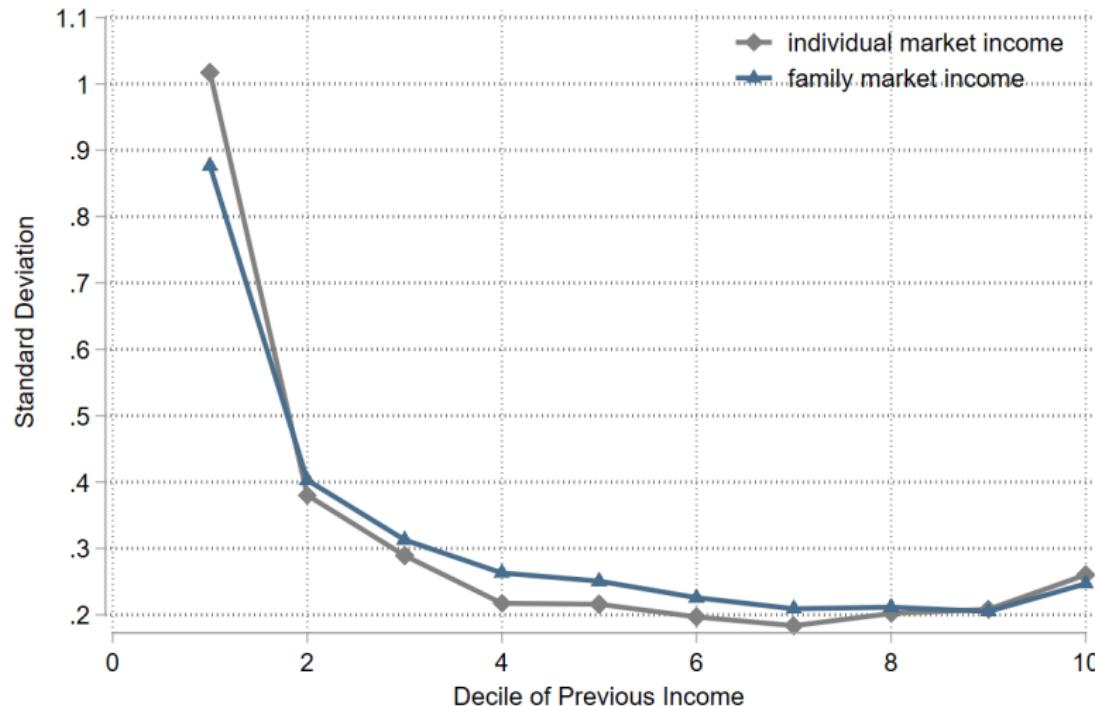

Example: Insurance against 2nd-order earnings risk

Primary earner's market income

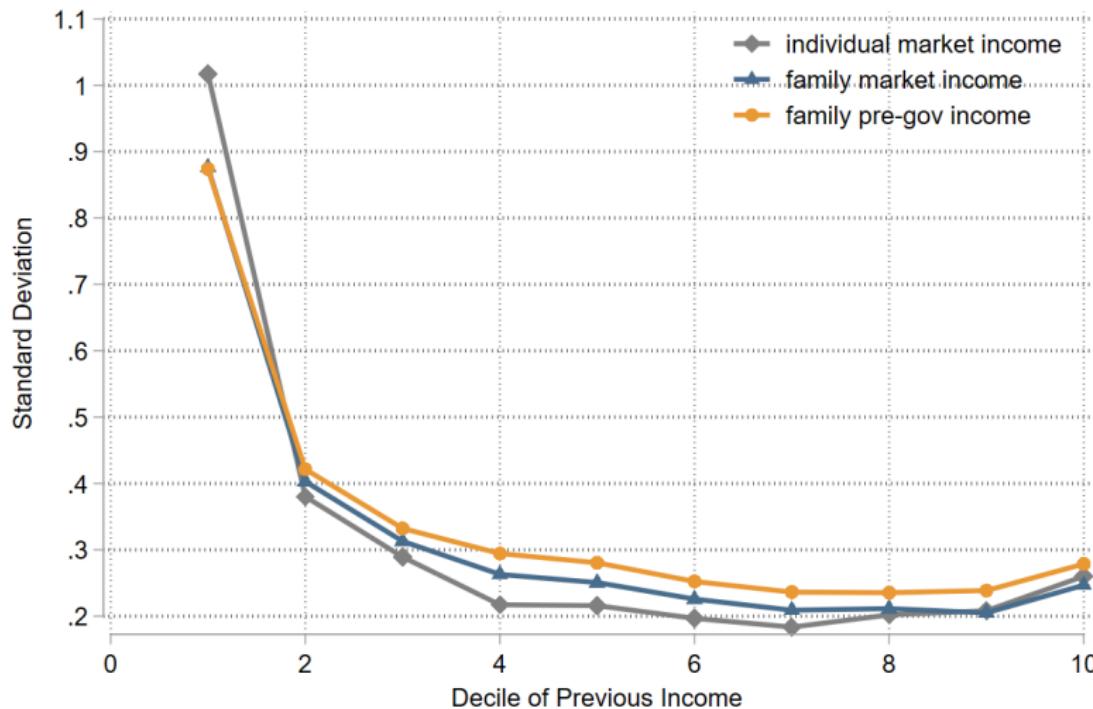

Example: Insurance against 2nd-order earnings risk

Primary earner's market income + Secondary earners' market income

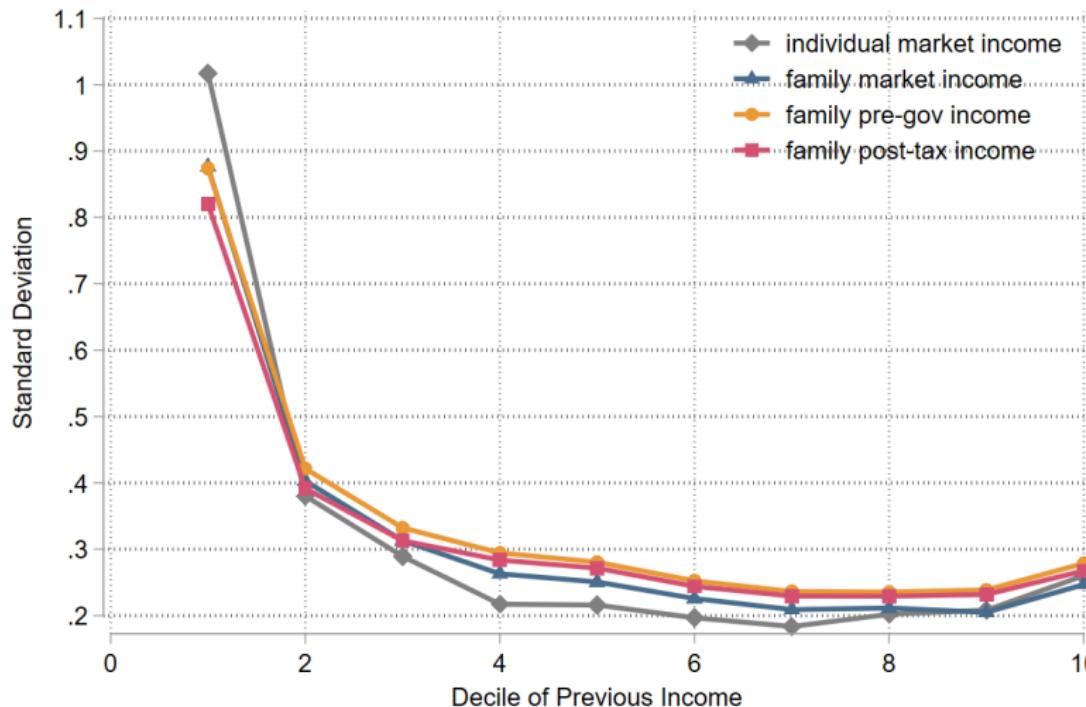

Example: Insurance against 2nd-order earnings risk

Primary earner's market income + Secondary earners' market income +
Private transfers

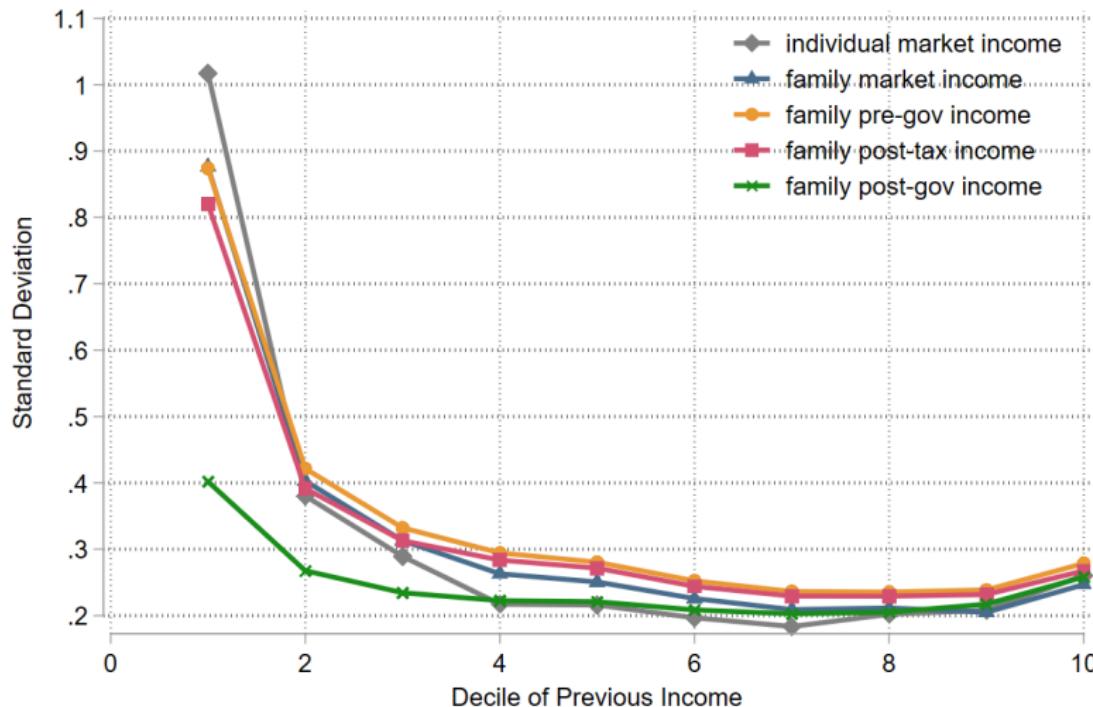

Example: Insurance against 2nd-order earnings risk

Primary earner's market income + Secondary earners' market income +
Private transfers – (Combined taxes - Concessions)

Example: Insurance against 2nd-order earnings risk

Primary earner's market income + Secondary earners' market income +
Private transfers – (Combined taxes - Concessions) + Public transfers

Related literature

Non-gaussian properties of earnings dynamics:

- ▶ Guvenen et al. (2021): US;
- ▶ Halvorsen et al. (2020): Norway;
- ▶ De Nardi et al. (2021): US and Netherlands.

Studies in Australia:

- ▶ Gaussian shocks:
 - ▶ Chatterjee et al. (2016); Freestone (2018): Wage inequality and unobserved shocks;
 - ▶ Kaplan et al. (2018): Consumption and income inequality;
- ▶ Level and first moment of income:
 - ▶ Herault and Azpitarte (2015): Redistributive impact of tax and transfer;
 - ▶ Tran and Zakariyya (2021): Trends in tax progressivity and redistribution.

Main results

Main results for Australia are:

1. Non-linear and non-Gaussian income dynamics;
2. Shock distributions are highly left skewed and leptokurtic;
3. Substantial government and family insurance against risks;
4. These features of income dynamics are persistent.

Cross-country comparison

	Australia	the Netherlands	US
<i>Driver of earnings risk</i>			
Dispersion	Wages	Wages & Hours*	Wages & Hours
Left Skewness	Hours	Hours	Hours
Excess Kurtosis	Hours	Hours	Hours
<i>Main insurance</i>			
Dispersion	Gov't	Gov't	Family & Gov't
Left Skewness	Family	Family & Gov't	Family
Excess Kurtosis	Family	Family & Gov't	Family

*Note: In the Netherlands, hour changes contribute more to earnings dispersion at the lower income deciles

New findings and key lessons

What's new?

1. Income risks are more persistent for certain groups;
2. Risk equalizing effect of government insurance;
3. Within-country evidence of crowding-out effect of government insurance;

Key lessons and recommendations:

1. Institutional structure may explain the cross-country differences;
2. Risk gap and welfare effect of redistribution;
3. Persistent risks suggest the importance of government insurance, but *what explains the persistence of risks?*
4. Government insurance may crowd out family insurance;
5. More realistic shock properties in models can offer new insights.

Summary statistics of primary earners in 2001

Primary Earner		N	Mean	Median	SD	Min	Max
Age	Individual	3,872	40.82	40	9.73	25	64
	Family	3,872	-	-	-	-	-

Derive moments of shocks: Non-parametric approach

Purge age and time effects:

$$\log \text{income}_{i,t} = \text{age}_{i,t} + \text{age}_{i,t}^2 + \text{year}_t + \mu_{i,t} \quad (1)$$

Calculate the n^{th} -order differences of $\hat{\mu}_{i,t}$:

$$\Delta_{\hat{\mu}_{i,t}}^n = \hat{\mu}_{i,t} - \hat{\mu}_{i,t-n} \quad (2)$$

Group the residual shocks $\Delta_{\hat{\mu}_{i,t}}^n$ by (i) age and (ii) past income decile.

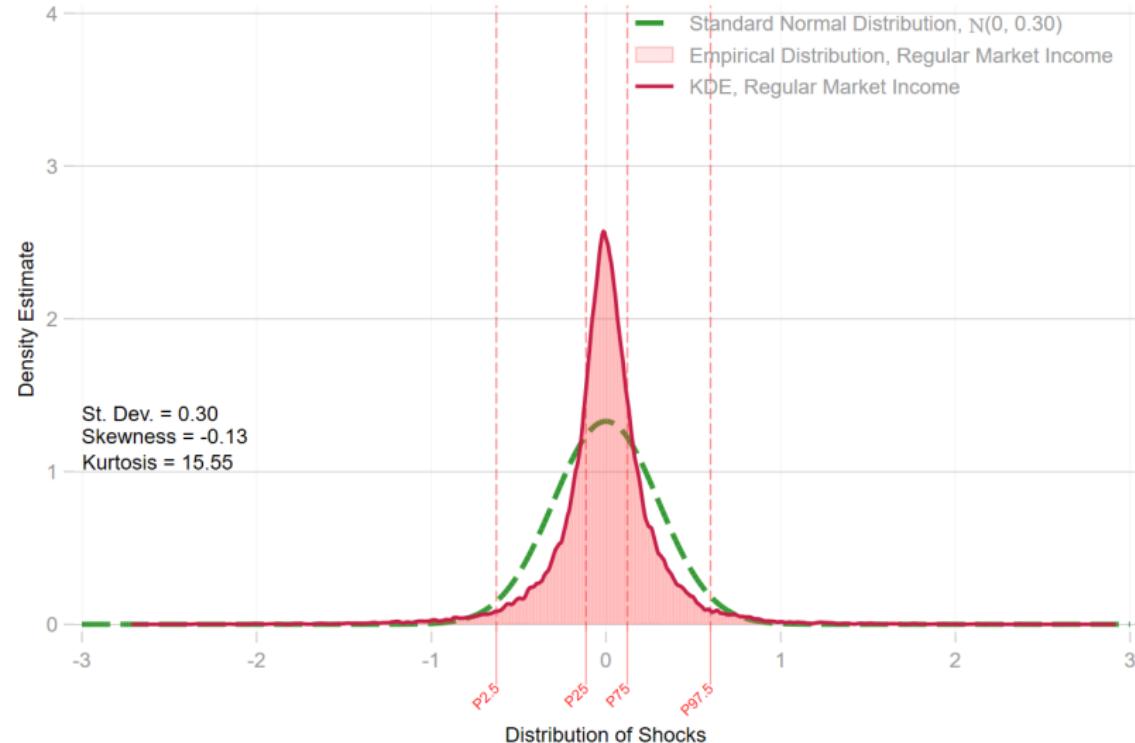

Calculate moments of the shock distributions for each group:

$$\tilde{\mu}_{\Delta y}^k = \frac{E[(\Delta y - \mu_{\Delta y})^k]}{\sigma^k} \quad (3)$$

where $\tilde{\mu}_{\Delta y}^k :=$ the k^{th} standardized moment of y shocks (k^{th} -order risks).

See derivation of shock moments via parametric approach in the appendix.

Empirical distribution of 3-year average residual earnings shocks

[◀ Back to Introduction](#)

Summary of analytical framework

Summary of analytical framework:

1. Calculate moments of distributions of residual income changes (*risks*);
2. Decompose the moment estimates to study sources of risks (See appendix);
3. Examine the degree of insurance by family and government.

Decomposition: Dispersion of shocks

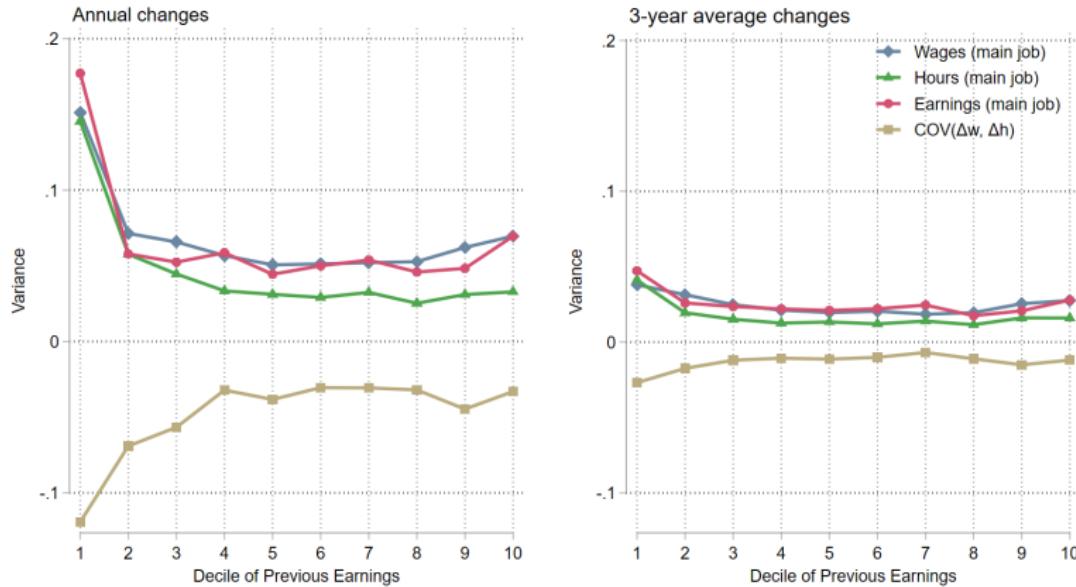

Figure: Variances of annual and 3-year average changes in usual weekly earnings, wages, and hours of primary earners

See derivation of decomposition formulae in the appendix.

Decomposition: Skewness and Kurtosis of shocks

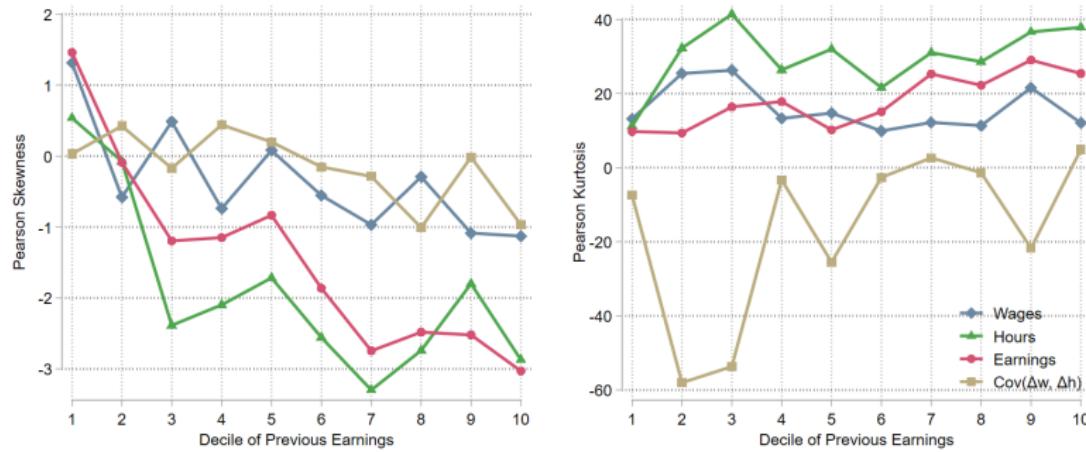

Figure: Pearson Skewness and Pearson Kurtosis of annual average changes in usual weekly earnings, wages, and hours of main job of primary earners (at least 18 years of employment)

See derivation of decomposition formulae in the appendix.

Wage and Hour changes vs. Earnings changes

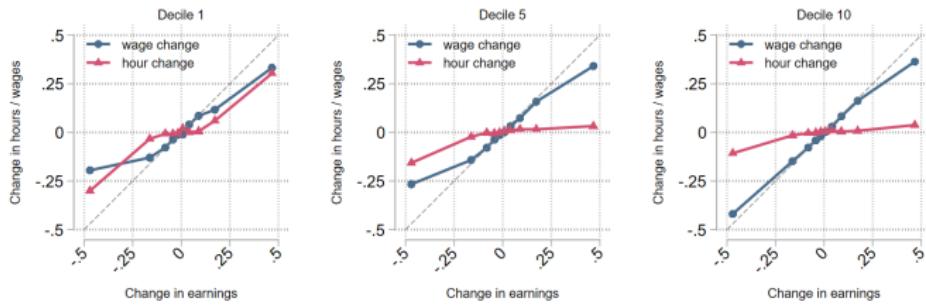

Figure: Annual changes in residual weekly wages and hours versus decile of annual changes in residual usual weekly earnings for primary earners in the 1st, 5th, and 9th deciles of past usual weekly earnings

See corresponding 3-year average change statistics in the appendix.

Family insurance against 2nd-order risk

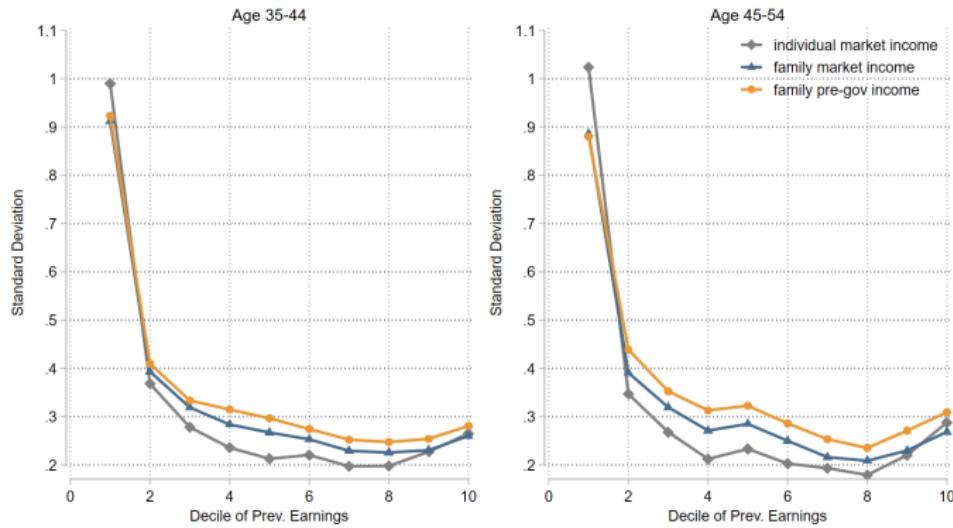

Figure: Standard deviation of the distribution of annual changes of family income (P1-P99) at different levels.

See a more detailed figure in the appendix.

Government insurance against 2nd-order risk

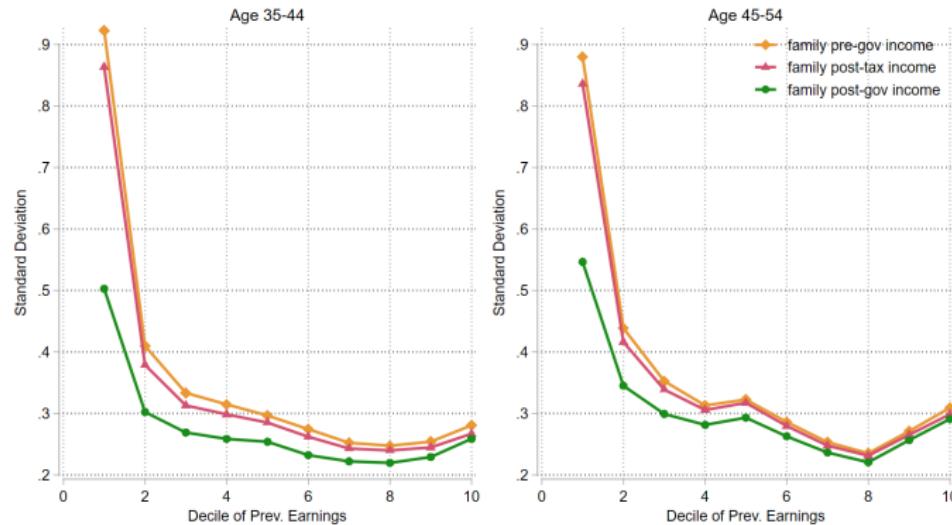

Figure: Standard deviation of the distribution of annual changes of post-tax and disposable (or post-government) family income (P1-P99) at different levels.

See a more detailed figure in the appendix.

Family insurance against 3rd- and 4th-order risks

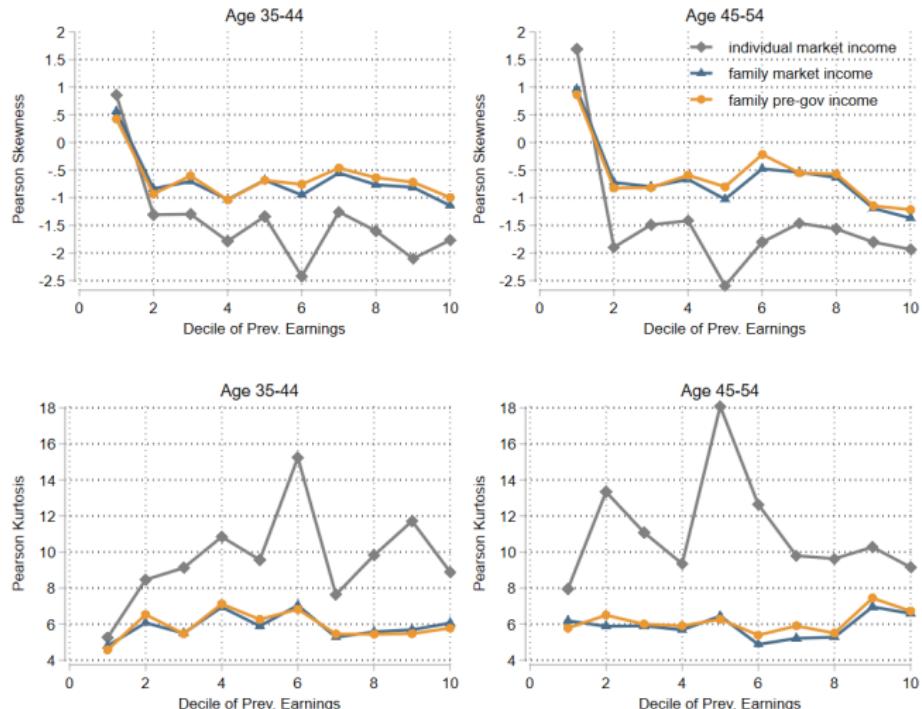

Figure: Standardized Skewness (top) and Kurtosis (bottom) of the distribution of annual changes of family income (P1-P99) at different levels.

Government insurance against 3rd- and 4th-order risks

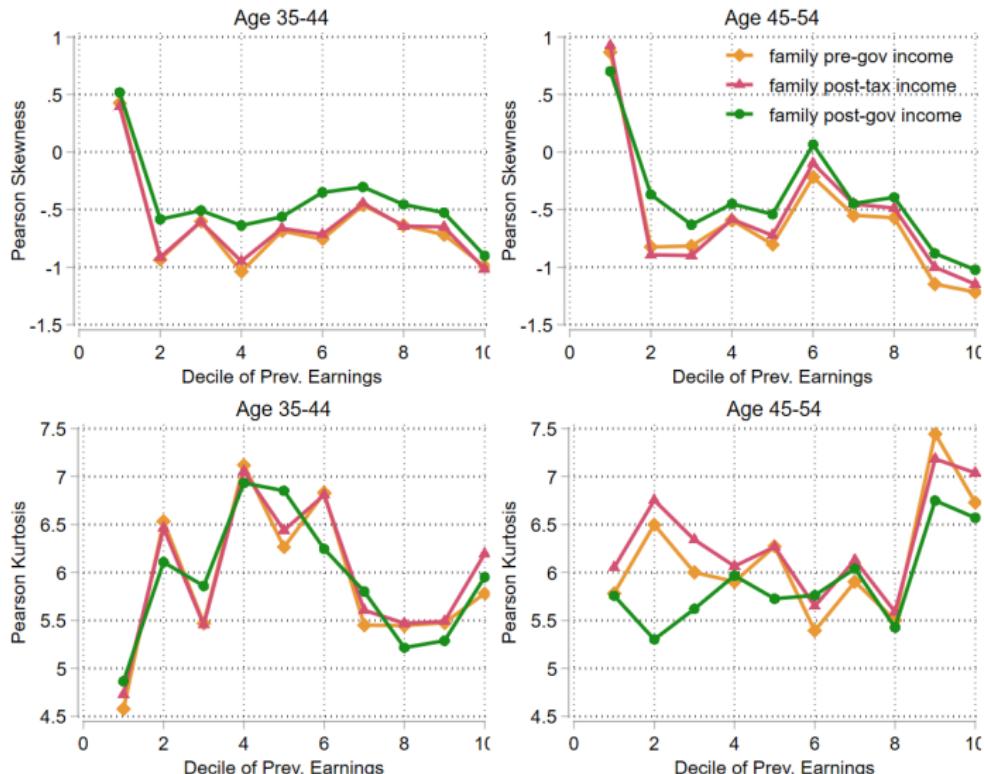

Figure: Standardized Skewness (top) and Kurtosis (bottom) of the distribution of annual changes of post-tax and disposable (or post-government) family income (P1-P99) at different levels.

Insurance against *transitory* shocks: Male vs. Female

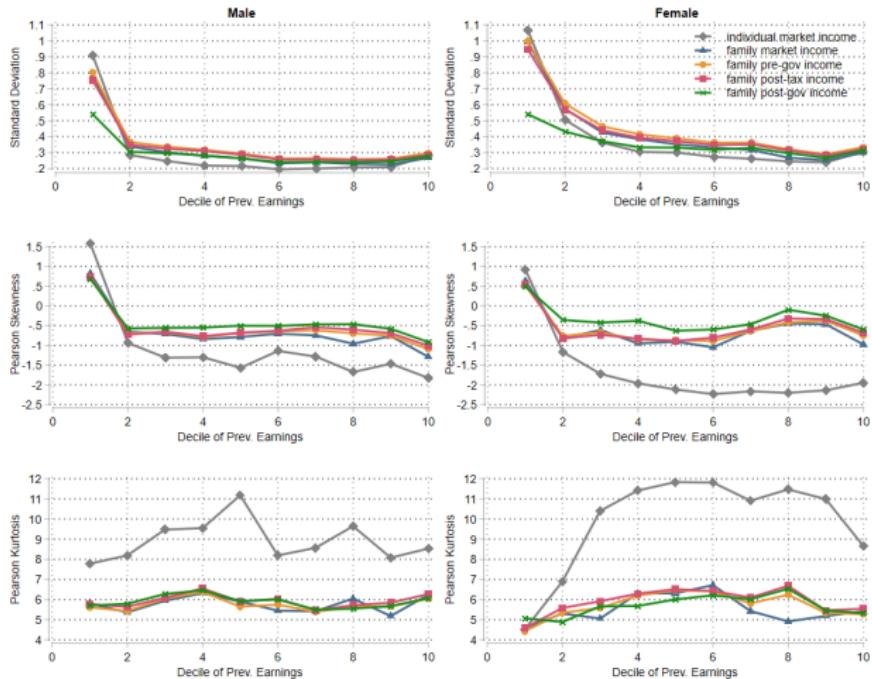

Figure: Moment properties of the distributions of annual income shocks of male (left panel) and female (right panel) primary earners (P1-P99 Pearson statistics).

Insurance against *persistent* shocks: Male vs. Female

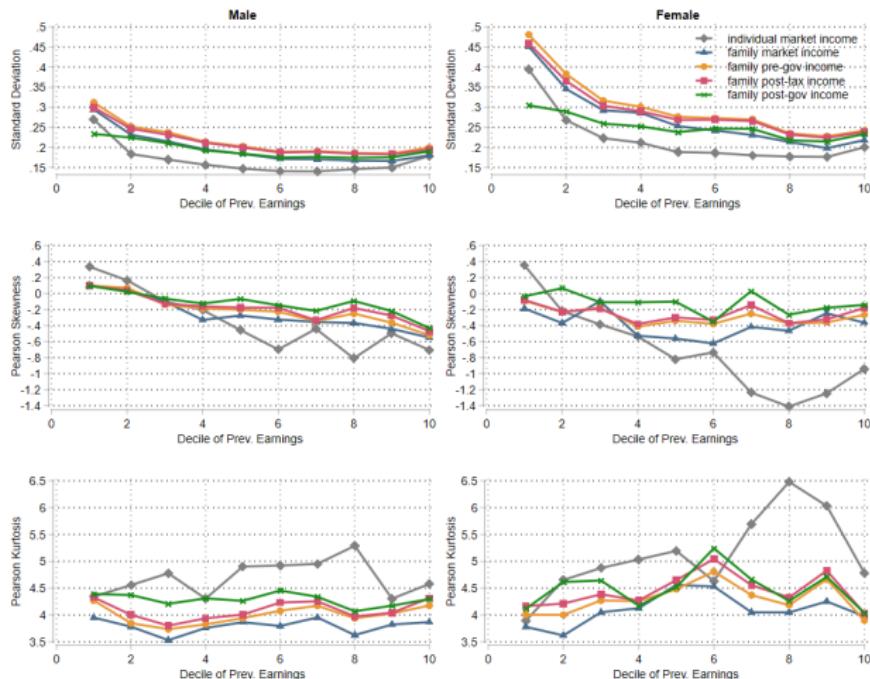

Figure: Moment properties of the distributions of 3-year average income shocks of male (left panel) and female (right panel) primary earners (P1-P99 Pearson statistics)

Spousal response vs Public transfer

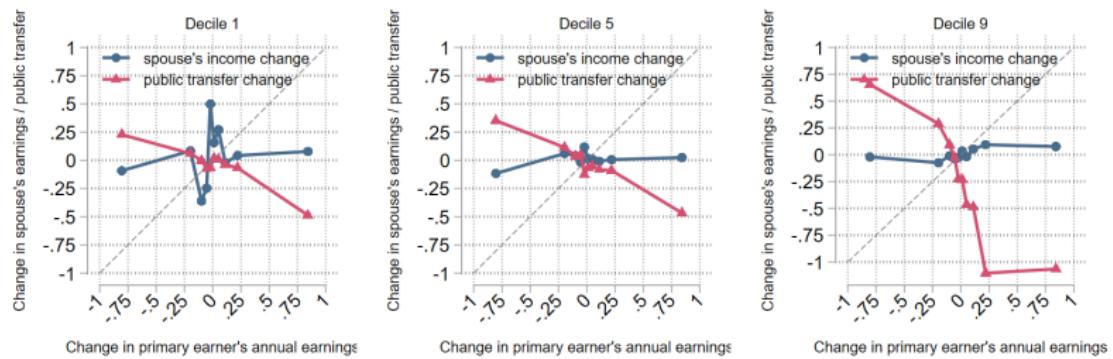

Figure: Annual changes in spousal earnings and public transfers versus decile of annual changes in past market earnings of primary earners in the 1st, 5th, and 9th deciles of past regular market income.

See a more detailed figure in the appendix.

Insurance against *transitory* shocks: Partnered vs. Lone parents

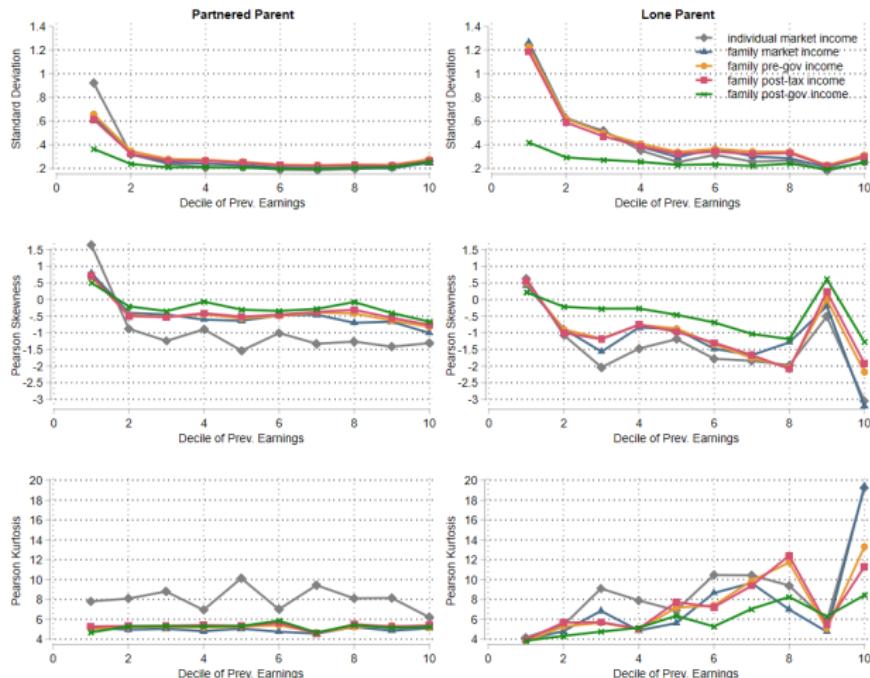

Figure: Moment properties of the distributions of annual income shocks of partnered parent (left panel) and lone parent (right panel) primary earners (P1-P99 Pearson distribution).

Conclusion remarks

Our findings on the dynamics of income suggest:

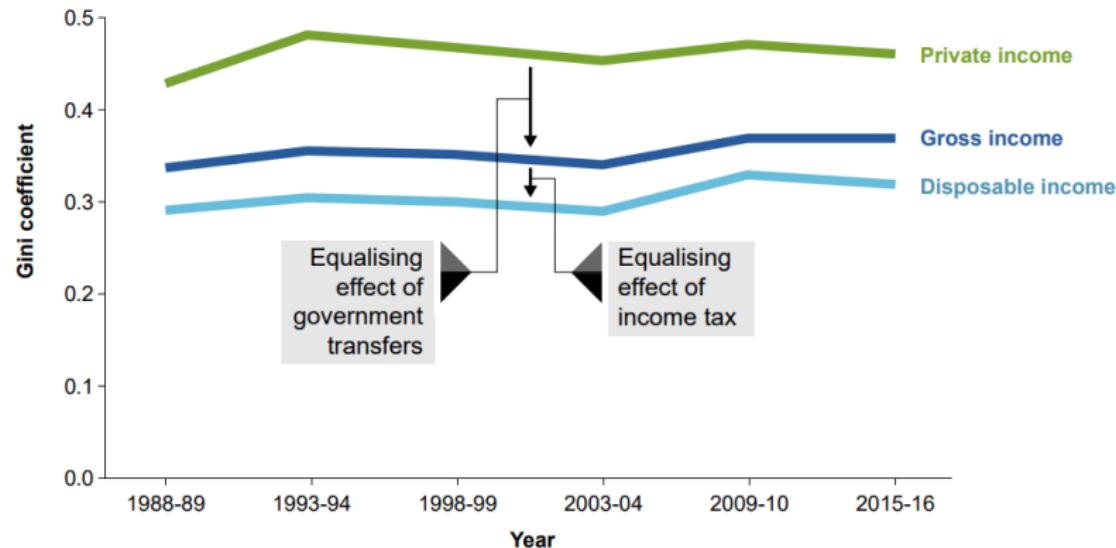

1. Similar earnings dynamics in Australia as in other OECD countries;
2. Some differences with regards to the sources of risks and insurance;
3. Understanding earnings risks and insurance against risks is crucial for designing optimal tax and transfer policies.

Future work:

1. Topics: retirees and age pension; consumption risk;
2. Data: Administrative data
3. Modelling: Mapping microdata to macroeconomic model

Appendix: Inequality and the role of government in Australia

Gini coefficients for equivalised income

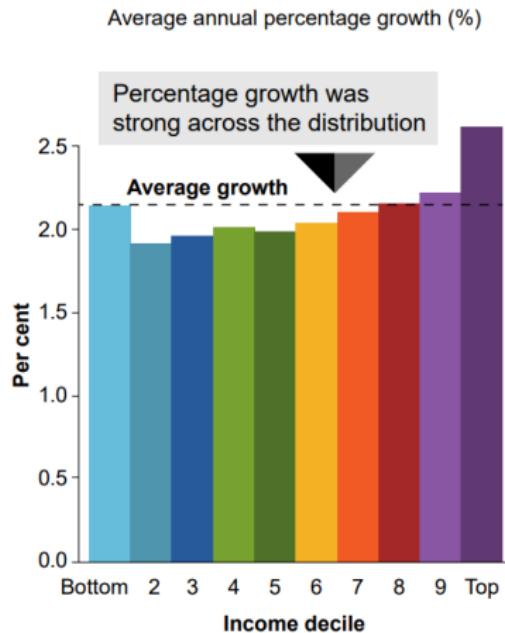

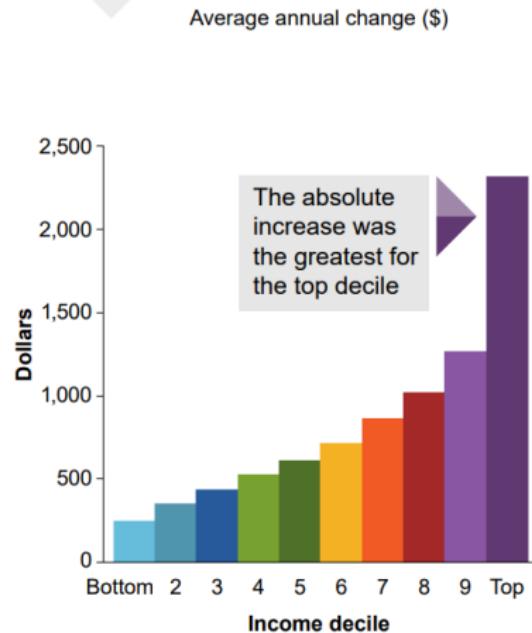

Data: ABS (Microdata: Household Expenditure, Income and Housing, 2015-16, Cat. no. 6540.0, released 25/10/17) and ABS HES Basic confidentialised unit record files for years 1988-89 through 2009-10 as available at 25/10/17. **Source:** *Rising Inequality? A stocktake of the evidence (Productivity Commission, 2018)*.

See appendix for comparison between average annual income growth

Appendix: Average disposable income growth (PC)

Average equivalised disposable income by income decile, 1988-89 to 2015-16

Data: ABS (Microdata: Household Expenditure, Income and Housing, 2015-16, Cat. no. 6540.0, released 25/10/17) and ABS HES Basic confidentialised unit record file for 1988-89 as available at 25/10/17.

Source: *Rising inequality? A stocktake of the evidence (Productivity Commission, 2018)*.

Appendix: Average annual growth of residual income by decile using equation 1

Income Decile	N	Individual	Individual	Household	Household
		Labour Income	Market Income	Pre-gov't Income	Disposable Income
1	10,965	58.64%	56.27%	29.11%	16.23%
2	10,964	5.86%	5.97%	4.17%	0.22%
3	10,950	-0.88%	-0.24%	2.54%	-0.01%
4	10,940	-3.20%	-3.20%	-0.56%	-1.42%
5	10,982	-4.45%	-4.03%	-1.73%	1.00%
6	10,930	-4.86%	-4.82%	-2.49%	-1.85%
7	10,950	-4.51%	-4.79%	-2.31%	-1.90%
8	10,947	-4.17%	-4.84%	-3.95%	-1.89%
9	10,953	-5.39%	-6.17%	-3.60%	-2.82%
10	10,948	-7.80%	-10.00%	-7.16%	-5.83%

Table 3: Average Annual Residual Income Growth (2001-2020) of Employees. The growth statistics shown are for employees (not self-employed) age 25-64. The residual changes are obtained from controlling for time and age effects (see equation 1). The figures account for cross-decile mobility over time.

Appendix: Derive moments of shocks via parametric approach (1)

Consider a parsimonious model for the residual income in equation 1:

$$\hat{\mu}_{i,t} = z_{i,t} + \epsilon_{i,t} \quad (4)$$

$$z_{i,t} = z_{i,t-1} + \eta_{i,t} \quad (5)$$

where $\eta_{i,t}$ and $\epsilon_{i,t}$ are drawn from some distributions $F_\eta \sim (0, \sigma_\eta^2)$ and $F_\epsilon \sim (0, \sigma_\epsilon^2)$, respectively.

The n -year growth of $\hat{\mu}_{i,t}$ is thus:

$$\Delta_{\hat{\mu}_{i,t}}^n = \hat{\mu}_{i,t} - \hat{\mu}_{i,t-n} \quad (6)$$

$$= \sum_{j=t-n+1}^t \eta_{i,j} + \epsilon_{i,t} - \epsilon_{i,t-n} \quad (7)$$

Appendix: Derive moments of shocks via parametric approach (2)

Given the parametric model 7, the higher-order moments of the distribution of $\Delta_{\hat{\mu}_{i,t}}^n$ are:

$$\sigma_{\Delta_{\hat{\mu}_{i,t}}^n}^2 = n\sigma_\eta^2 + 2\sigma_\epsilon^2 \quad (8)$$

$$S_{\Delta_{\hat{\mu}_{i,t}}^n}^n = \frac{n \times \sigma_\eta^3}{(n\sigma_\eta^2 + 2\sigma_\epsilon^2)^{\frac{3}{2}}} S_\eta \quad (9)$$

$$K_{\Delta_{\hat{\mu}_{i,t}}^n}^n = \frac{n \times \sigma_\eta^4}{(n\sigma_\eta^2 + 2\sigma_\epsilon^2)^2} K_\eta + \frac{2 \times \sigma_\epsilon^4}{(n\sigma_\eta^2 + 2\sigma_\epsilon^2)^2} K_\epsilon \quad (10)$$

Assuming $N_\eta \sim (0, \sigma_\eta^2)$ and $N_\epsilon \sim (0, \sigma_\epsilon^2)$, we can estimate σ_η and σ_ϵ (as in Chatterjee et al. (2016)) and work out the three moment statistics.

Appendix: Additional consideration

We use quantile-based measures of skewness and kurtosis for comparability with the previous studies.

$$S_{kelley} = \frac{(P_{90} - P_{50}) - (P_{50} - P_{10})}{P_{90} - P_{10}} \quad (11)$$

$$K_{crow-siddiqui} = \frac{P_{97.5} - P_{2.5}}{P_{75} - P_{25}} \quad (12)$$

We consider robust moment statistics: $P1-P99$, $P5-P95$, and $P10-P90$.

Alternatively, using Arc-Percent Change method yields similar results.

Appendix: Decompose earnings shocks (1)

We have:

$$y_{i,t} = w_{i,t} \times h_{i,t} \quad (13)$$

$$\implies \frac{\% \Delta y_{i,t}}{dt} = \frac{\% \Delta w_{i,t}}{dt} + \frac{\% \Delta h_{i,t}}{dt} \quad (14)$$

which can be simplified as

$$\Delta y = \Delta w + \Delta h \quad (15)$$

Let $\tilde{\mu}_z^k := \mathbb{E} \left(\frac{z - \mu_z}{\sigma_z} \right)^k$ and $\sigma_z := \sqrt{\text{var}(z)}$ for a random variable z .

Appendix: Decompose earnings shocks (2)

Second moment:

$$\sigma_{\Delta y}^2 = \sigma_{\Delta w}^2 + \sigma_{\Delta h}^2 - 2\text{cov}(\Delta w, \Delta h) \quad (16)$$

Third moment:

$$\begin{aligned}\tilde{\mu}_{\Delta y}^3 &= \frac{1}{\sigma_{\Delta y}^3} [\sigma_{\Delta w}^3 \tilde{\mu}_{\Delta w}^3 + \sigma_{\Delta h}^3 \tilde{\mu}_{\Delta h}^3] \\ &\quad + \frac{3}{\sigma_{\Delta y}^3} [\mathbb{E}(\Delta h - \mu_{\Delta h})^2 (\Delta w - \mu_{\Delta w}) + \mathbb{E}(\Delta w - \mu_{\Delta w})^2 (\Delta h - \mu_{\Delta h})]\end{aligned} \quad (17)$$

Fourth moment:

$$\begin{aligned}\tilde{\mu}_{\Delta y}^4 &= \frac{1}{\sigma_{\Delta y}^4} [\sigma_{\Delta w}^4 \tilde{\mu}_{\Delta w}^4 + \sigma_{\Delta h}^4 \tilde{\mu}_{\Delta h}^4] \\ &\quad + \frac{4}{\sigma_{\Delta y}^4} \mathbb{E} [(\Delta h - \mu_{\Delta h})^3 (\Delta w - \mu_{\Delta w}) + (\Delta w - \mu_{\Delta w})^3 (\Delta h - \mu_{\Delta h})] \\ &\quad + \frac{6}{\sigma_{\Delta y}^4} \mathbb{E} [(\Delta w - \mu_{\Delta w})^2 (\Delta h - \mu_{\Delta h})^2]\end{aligned} \quad (18)$$

Appendix: Volatility of shocks by income and age

Appendix: Wage and Hour changes vs. Earnings changes

Annual changes

Average 3-year changes

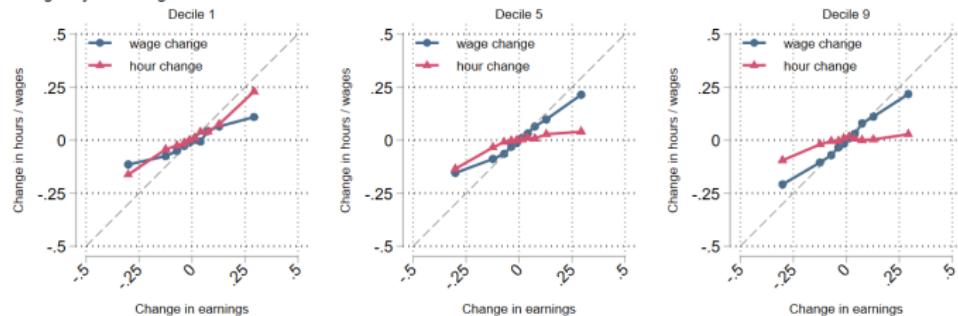

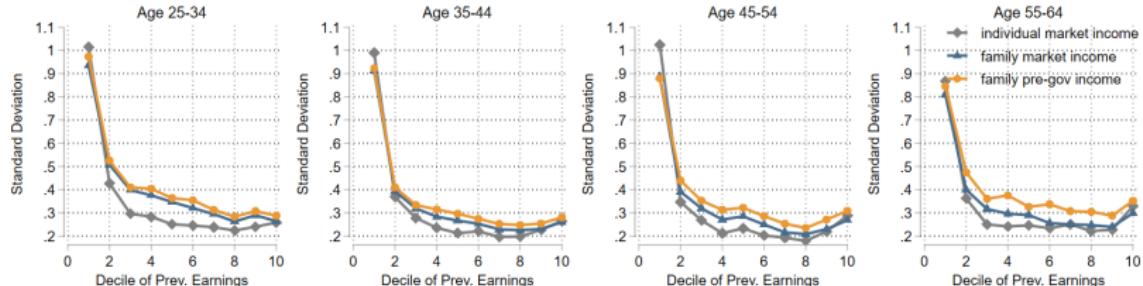

Figure: Changes in residual weekly wages and hours versus decile of changes in residual usual weekly earnings for primary earners in the 1st, 5th, and 9th deciles of past usual weekly earnings

Appendix: Family insurance against 2nd-order risk

Annual changes

3-year average changes

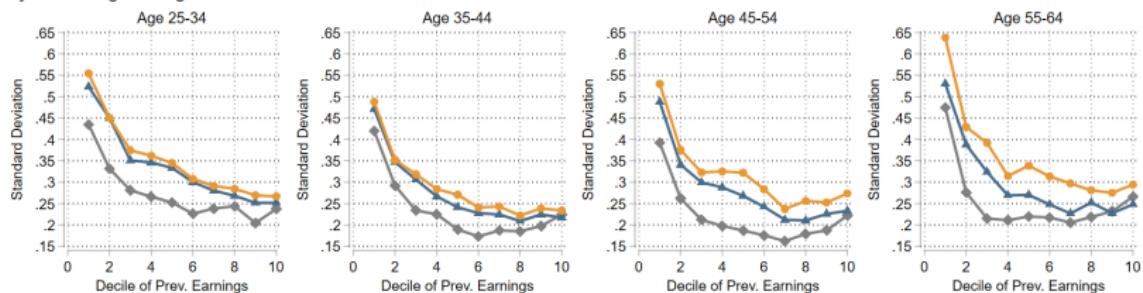

Figure: Standard deviation of the distribution of annual and 3-year average changes of family income (P1-P99) at different levels. The figure captures the relative contribution of family market income and private transfer to the second-order risk of pre-government family income.

Appendix: Family insurance against 3rd- and 4th-order risks (1)

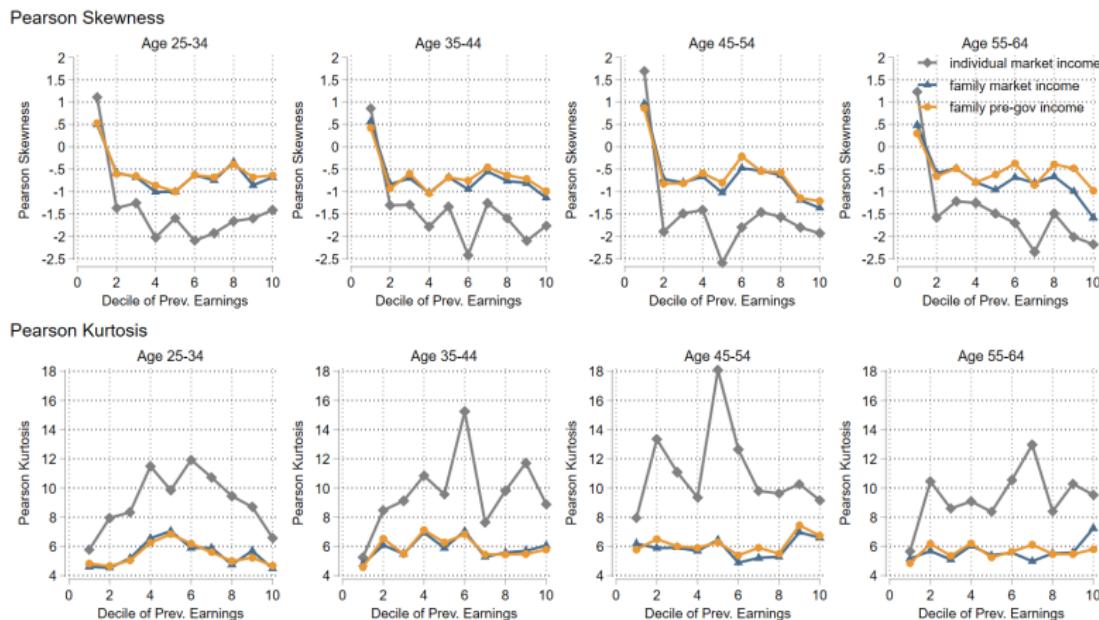

Figure: Skewness (top) and Kurtosis (bottom) of the distribution of annual changes of family income (P1-P99) at different levels. The figure captures the relative contribution of family market income and private transfer to the third- and fourth-order risks of pre-government family income.

Appendix: Family insurance against 3rd- and 4th-order risks (2)

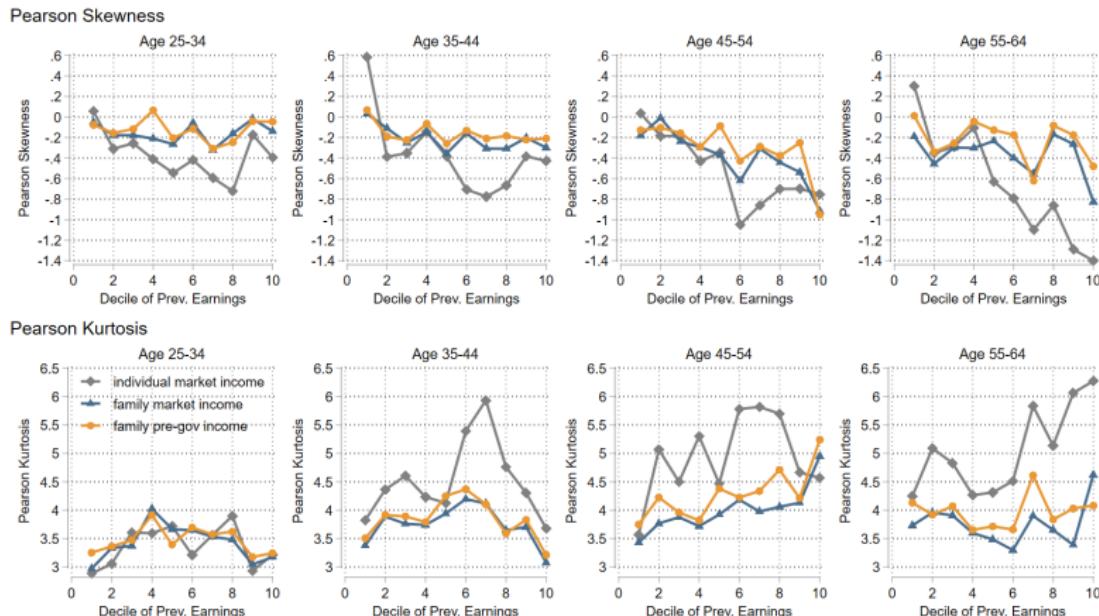

Figure: Skewness (top) and Kurtosis (bottom) of the distribution of 3-year average changes of family income (P1-P99) at different levels. The figure captures the relative contribution of family market income and private transfer to the third- and fourth-order risks of pre-government family income.

Appendix: Gov't insurance against 2nd-order risks

Annual changes

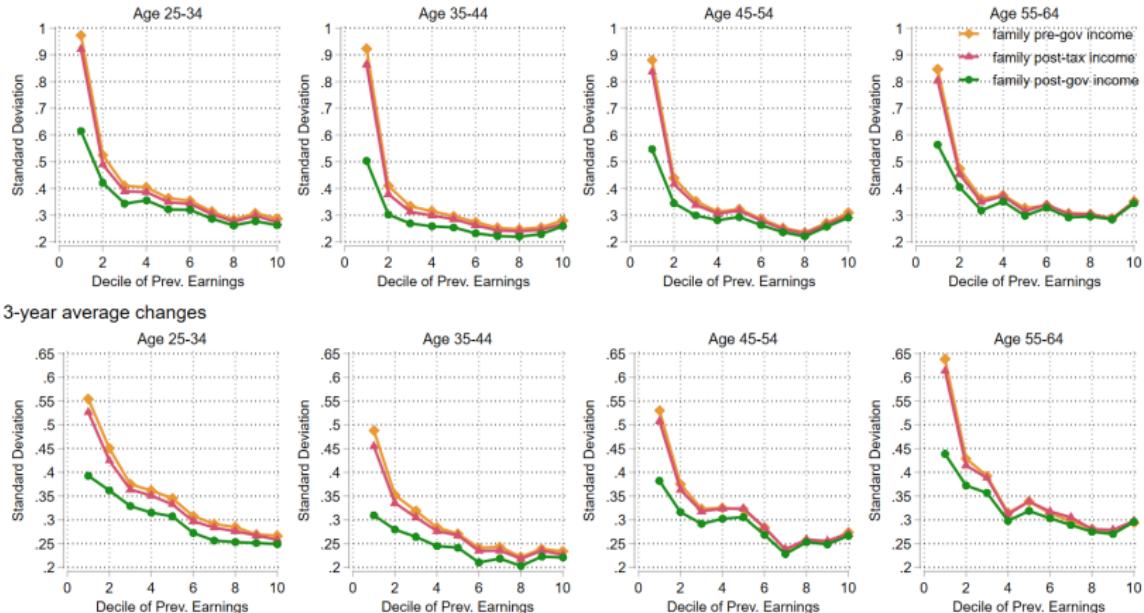

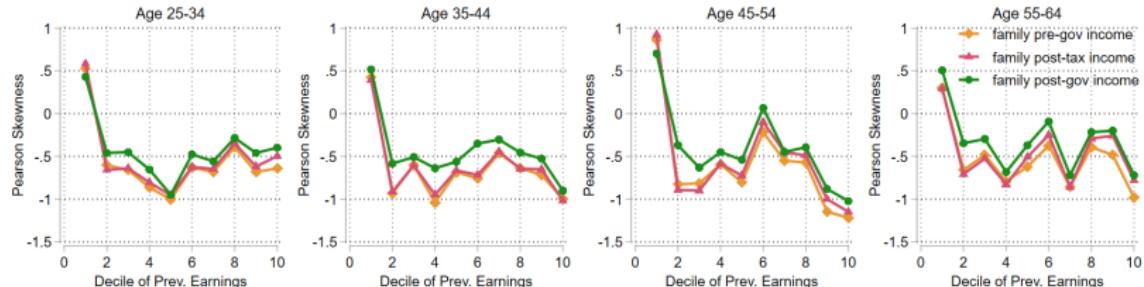

Figure: Standard deviation of the distribution of annual and 3-year average changes of post-tax and disposable (or post-government) family income (P1-P99) at different levels. The figure captures the relative contribution of tax and transfer to the second-order risk of disposable family income.

Appendix: Gov't insurance against 3rd- and 4th-order risks

Skewness

Kurtosis

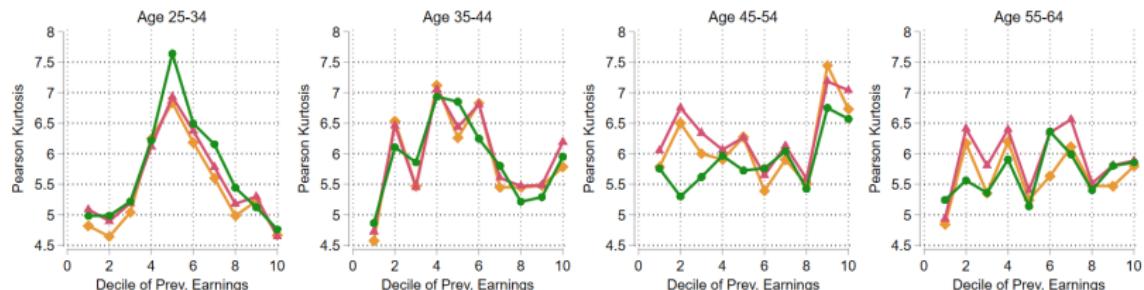

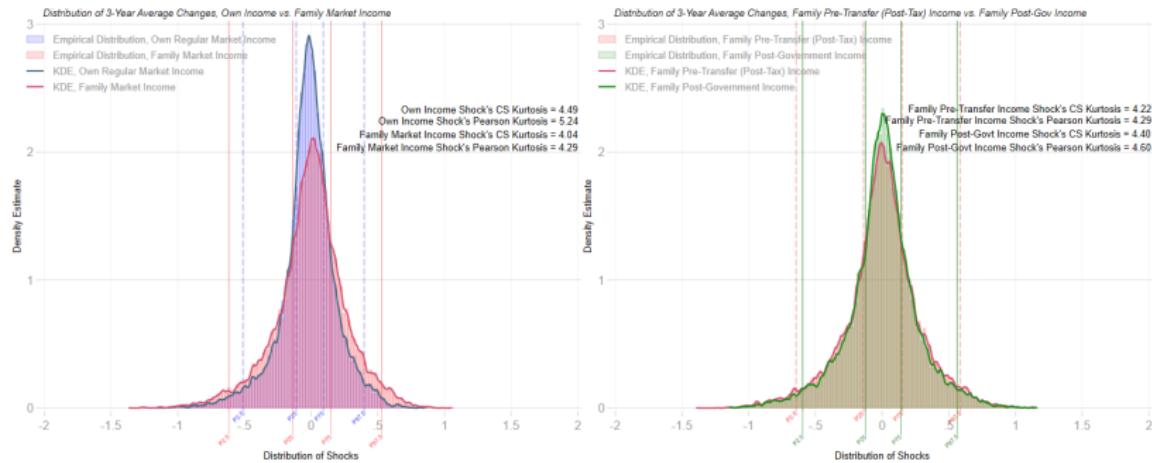

Figure: Skewness (top) and Kurtosis (bottom) of the distribution of annual changes of post-tax and disposable (or post-government) family income (P1-P99) at different levels. The figure captures the relative contribution of tax and transfer to the third- and fourth-order risks of disposable family income.

Appendix: A closer look at kurtosis

A smaller kurtosis can originate from either: (i) *the contraction of density mass about the mean* (more households facing moderate shocks), or (ii) *the contraction of mass at the tailends* (fewer households facing extreme shocks). While (ii) is a positive effect on households, (i) is not.

	Female	40	67%	31.9	\$958.34	\$50,298.72	\$1,670.62
5	Male	46.1	82%	41.5	\$1,670.71	\$104,266.79	\$885.92
	Female	42.9	76%	33.9	\$1,281.75	\$74,134.83	\$1,114.50

Table 4: Average 20-year statistics for male and female secondary earners by family market income quintile. All income and transfer values are stated in 2018 Australian dollar.

Appendix: Insurance against *transitory* shocks and parenthood

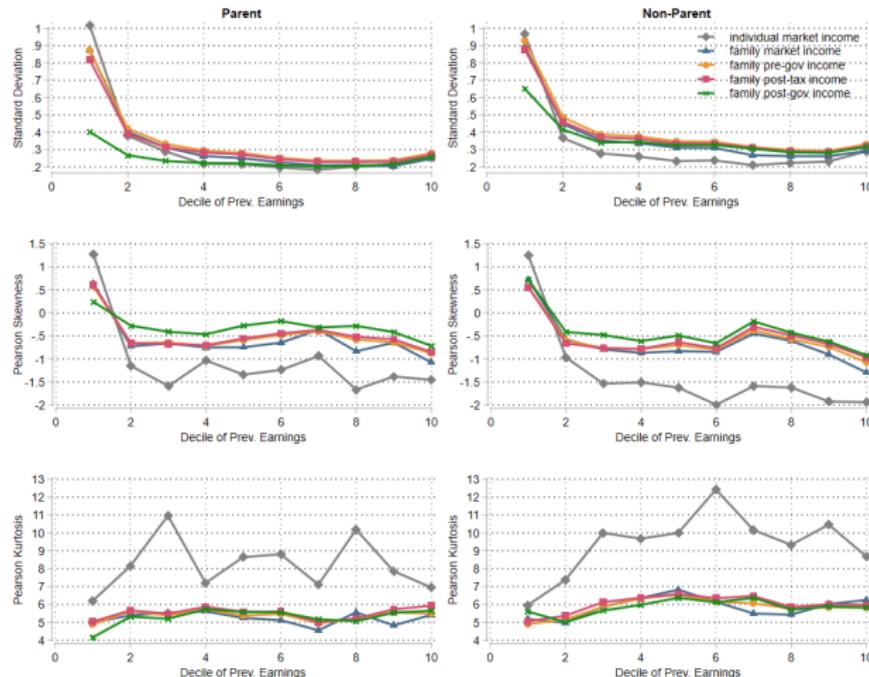

Figure: Moment properties of the distributions of annual income shocks of parent (left panel) and non-parent (right panel) primary earners (P1-P99 pearson statistics)

Appendix: Insurance against *persistent* shocks and parenthood

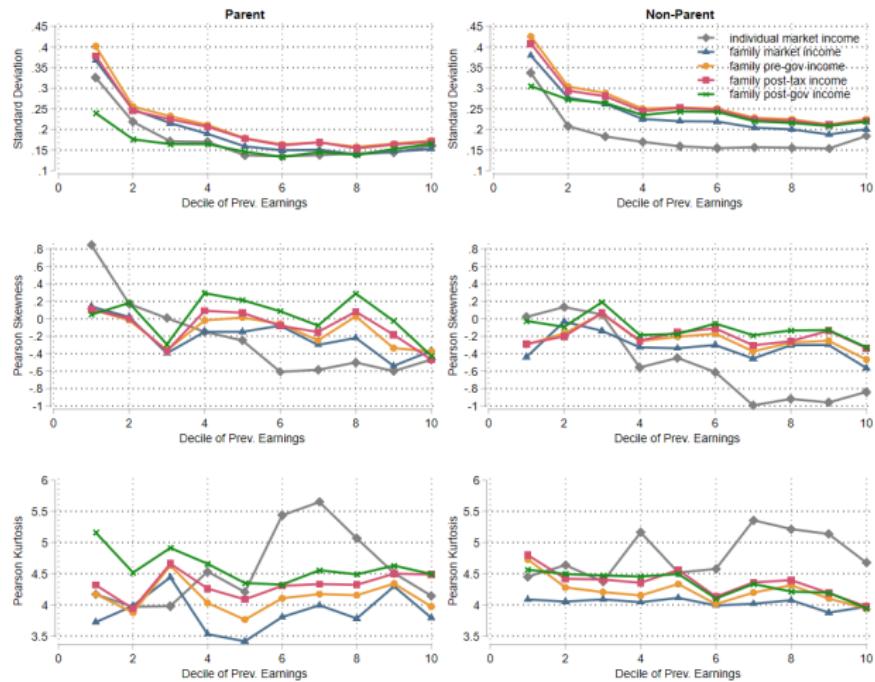

Figure: Moment properties of the distributions of 3-year average income shocks of parent (left panel) and non-parent (right panel) primary earners (P1-P99 Pearson participation).

Appendix: Age-profiles of work hours and LFP rate

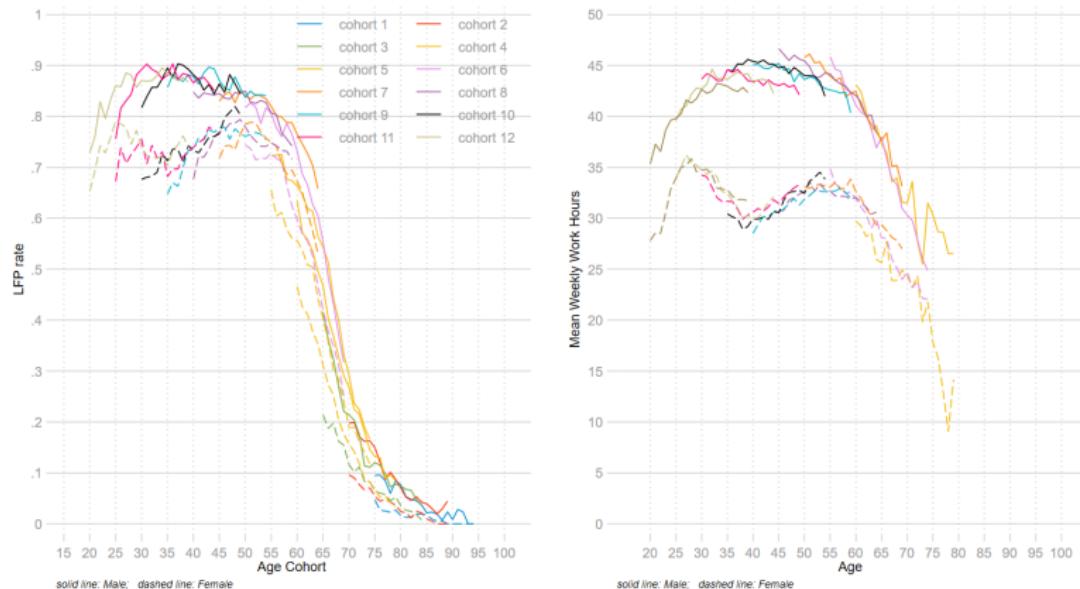

Figure: M-shaped age-profiles of work hours (left panel) and LFP rate (right panel). Solid line for men, dashed line for women.

Appendix: Spousal response vs Public transfer

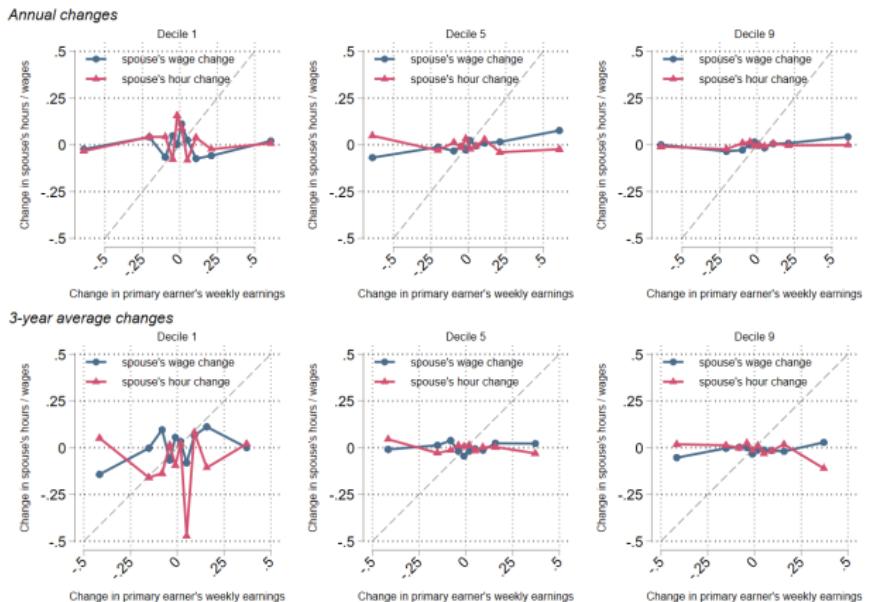

Figure: Changes in usual weekly wages and hours of spouse versus decile of changes in usual weekly earnings (main job) of primary earners in the 1st, 5th, and 9th deciles of past weekly earnings. The top and bottom panels report annual and 3-year average changes, respectively.

Appendix: Spousal response vs Public transfer

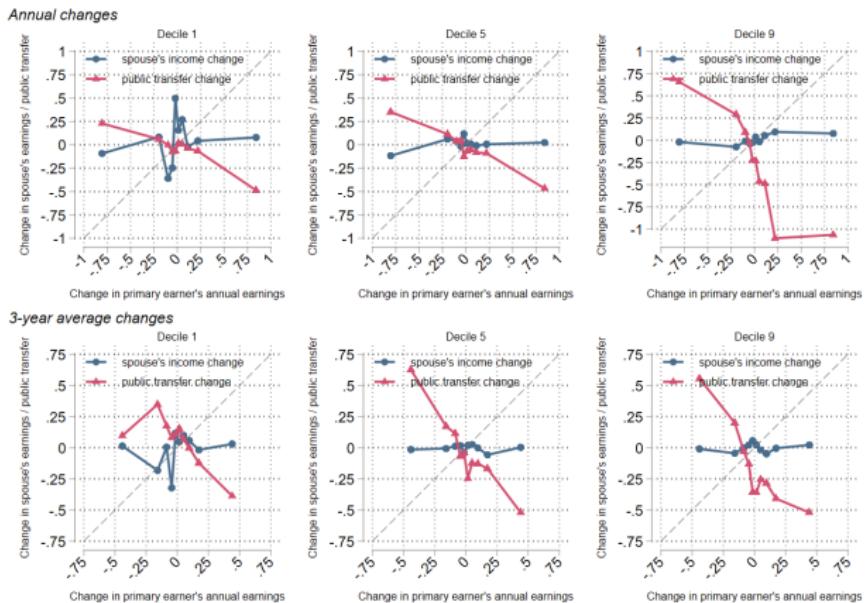

Figure: Changes in spousal earnings and public transfers versus decile of changes in past market earnings of primary earners in the 1st, 5th, and 9th deciles of past regular market income. The top and bottom panels report annual and 3-year average changes, respectively.

Table 7: Cross-tabulation of frequencies between parenthood, marital status, and gender. Since HILDA tracks individuals and their households over time, we present a snapshot of the first cohort entering the survey in 2001. The table suggests a negative assortative matching (or matching of unlike) between higher income males and lower income females.

Appendix: Additional statistics

Highest education attained	Married		Single		
	Male	Female	Male	Female	Total
High school or lower	1,226	2,227	639	494	4,586
	37.20%	59.45%	57.41%	54.11%	50.57%
	26.73%	48.56%	13.93%	10.77%	100.00%
Above high school, at most bachelor's degree	1,741	1,221	424	350	3,736
	52.82%	32.59%	38.10%	38.34%	41.20%
	46.60%	32.68%	11.35%	9.37%	100.00%

	9.98%	7.96%	4.49%	7.56%	8.23%
	44.10%	39.95%	6.70%	9.25%	100.00%
Total	3,296	3,746	1,113	913	9,068
%	100.00%	100.00%	100.00%	100.00%	100.00%
%	36.35%	41.31%	12.27%	10.07%	100.00%

Table 8: Cross-tabulation of frequency between education, marital status, and gender. Since HILDA tracks individuals and their households over time, we present a snapshot of the first cohort entering the survey in 2001. The table suggests a negative assortative matching (or matching of unlike) between higher education males and lower education females. The observed pattern becomes less pronounced in later years of the survey, partly due to attrition and the inclusion of new and younger households.
